Motivation

Theory

Practice

- 1 Motivation: Intrinsic coordinates
- 2 Theory: Persistent cohomology and circle-valued maps
- 3 Practice: Finding and interpreting parametrizations

Finding coordinates

Persistent
Cohomology
and
Circle-valued
coordinates

Mikael
Vejdemo-
Johansson
Vin de Silva
Dmitriy
Morozov

Motivation

Theory

Practice

- Overall goal is to understand pointclouds.
- Data comes with coordinates.
Different coordinate choice might concentrate the intrinsic information.
- We want to find few and very relevant intrinsic coordinates.
Ideal case: 2d or 3d plots with a clear and relevant geometry.

Problem cases

Persistent
Cohomology
and
Circle-valued
coordinates

Mikael
Vejdemo-
Johansson
Vin de Silva
Dmitriy
Morozov

Motivation

Theory

Practice

In order to find few intrinsic coordinates, we want to stick close to the local dimension.

Some shapes take up too many coordinates.

Locally 1-dimensional. Globally 2 coordinates needed to describe all points. The shape doesn't fit in \mathbb{R} .

Similar problems arise with sphere and torus.

Suggested fix

Persistent
Cohomology
and
Circle-valued
coordinates

Motivation

Theory

Practice

Circle-valued coordinates

- Use $S^1 = [0, 1]/(0 \sim 1)$ as additional coordinate space
- Fixes the circle
- Fixes the torus
- Occurs naturally:
 - Phase coordinates for waves
 - Angle coordinates for directions
 - Any recurrent phenomenon

Dmitriy
Morozov

Motivation

Theory

Practice

Problem remains: how do we find circle-valued coordinates?

Persistent cohomology

- Degree one cohomology equivalent to circle-valued maps
- Persistence picks out relevant features from noise
- Once a feature-rich parameter has been found, we can work in ordinary (non-persistent) cohomology theories

We compute persistent cohomology by adapting the zig zag persistence algorithm to the dual diagram.

From cohomology to circle-valued parametrizations

Persistent

Motivation

Theory

Practice

We use the natural isomorphism $H^1(X; \mathbb{Z}) \cong [X, S^1]$

Issues

- Easy to compute: $H^1(X; \mathbb{Z}/p)$, with coefficients over a small prime. Linear algebra, coefficients fit inside machine word, division in $O(1)$ by lookup tables.
Needed for the isomorphism: $H^1(X; \mathbb{Z})$.
We can, as long as $H^2(X; \mathbb{Z})$ has no p -torsion, lift $H^1(X; \mathbb{Z}/p) \rightarrow H^1(X; \mathbb{Z})$.
- The representative chains for $H^1(X; \mathbb{Z})$ yields very non-smooth maps: sends all data points to 0, and wraps the edges in the complex around the target circle.
We can smooth a cocycle in $C^1(X; \mathbb{Z})$ by moving it to a harmonic cocycle in $C^1(X; \mathbb{R}) \cap C_1(X; \mathbb{R})$ belonging to the same cohomology class in $H^1(X; \mathbb{Z})$.

Lee-Mumford-Pedersen, *The nonlinear statistics of high-contrast patches in natural images*, International Journal of Computer Vision 54(1/2/3), 83-103, 2003
 $4.2 \cdot 10^6$ pixel patches from 4167 calibrated 1020×1532 images.
Each 3×3 pixel patch obviously a vector in \mathbb{R}^9 . Normalized to constant intensity and to unit euclidean norm.
Transformed by a basis choice that highlights geometric features of the dataset itself.
Result lies on the unit 7-sphere in \mathbb{R}^8 .

We use the smoothing procedure developed by Jennifer Kloeke. Once smoothed to a circle, we parametrize with persistent cohomology, and can pull the parametrization back to the original data points.
