# Persistent homology

In a large variety of areas we encounter the following fundamental problem:

## Problem

Estimate topological features of a shape based on a family of sample points (*point clouds*).

## Applications

- ▶ The space of natural  $3 \times 3$  pixel patches is a Klein bottle.
- ▶ This Klein bottle yields new techniques for analyzing textures.
- ▶ Shape matching and shape databases.
- ▶ Filtering materials databases for high  $CO_2$  adsorbtivity.
- ▶ Verifying sensor coverage for plane regions.

# Persistent homology

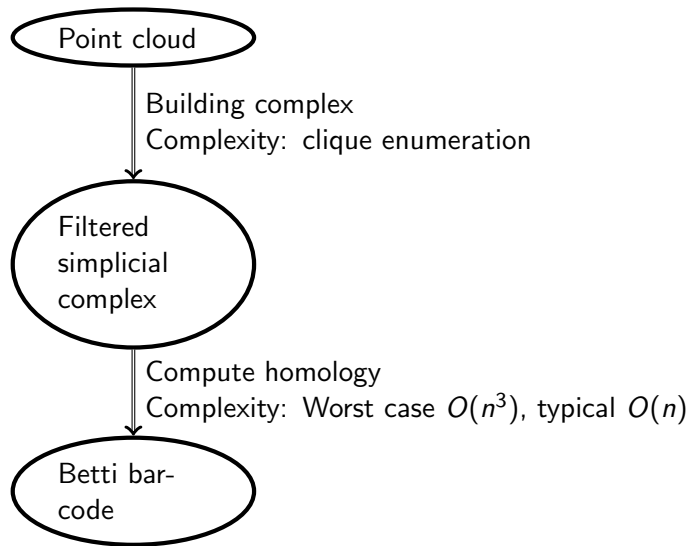

Our favourite solution is due to Edelsbrunner, Letscher and Zomorodian.

## Solution

Čech complexes, Vietoris-Rips complexes,  $\alpha$ -shapes and several other constructions capture by a filtered simplicial complex stemming from intersection relations of disks centered on the sample points

*Persistent homology* tracks the changes in topological features, and picks out such features that remain present over a long time.

# History of PLEX

Early developments in the theory of persistent homology took place at Stanford, as did the development of software to compute with point clouds.

1. PLEX
2. JPLEX

# History of PLEX

Early developments in the theory of persistent homology took place at Stanford, as did the development of software to compute with point clouds.

1. PLEX – C++, Matlab through MEX, memory hog
2. JPLEX – Java, Matlab natively, BeanShell, highly optimized

# Design properties for JAVAPLEX

JAVAPLEX grew out of dissatisfaction with both PLEX and JPLEX.

## Disadvantages

### PLEX

- ▶ Dependent on exact Matlab version and MEX dialect
- ▶ Design carrying *very* many pointers: high memory consumption

### JPLEX

- ▶ Too highly optimized: no real capacity to extend or modify
- ▶ Not actually competitive enough to motivate this

## Usage examples

This is joint work with David Eklund, Jonathan Hauenstein, Martina Scolamiero, and Chris Peterson.

### Application

Consider as a linkage the configurations of cyclo-octane ( $C_8H_{16}$ ). The carbon bonds in this have fixed length, and an angle of  $\arccos(-1/3) \simeq 109.47$ . By fixing one carbon atom at the origin, and its closest neighbours at  $(1, 0, 0)$  and  $(-\frac{1}{3}, \frac{2}{3}\sqrt{2}, 0)$ , we may study the distribution of the remaining atoms. The variety of possible configurations is a surface in  $\mathbb{R}^{15}$ .

This variety was first described by *Martin, Thompson, Coutsiias, and Watson* in TOPOLOGY OF CYCLO-OCTANE ENERGY LANDSCAPE. J. Chem. Phys. 132, 234115 (2010).

# Cyclo-octane

We sample, using BERTINI, points on the real singular locus of the cyclo-octane variety.

Using MATLAB and JAVAPLEX, we create a witness complex on 100 out of 1 606 sampled points:

# Cyclo-octane

```
>> load Distances.out;
>> m_space = metric.impl.ExplicitMetricSpace(Distances);
>> diam = metric.utility.MetricUtility.estimateDiameter(m_space);
>> r_max = diam/2
ans = 3.1017
>> landmarks = api.Plex4.createMaxMinSelector(m_space,100);
>> stream = api.Plex4.createWitnessStream(landmarks,3,r_max/2);
>> stream.getSize()
ans = 11418
>> persistence = api.Plex4.getDefaultSimplicialAlgorithm(3);
>> fii = persistence.computeIntervals(stream);
>> fvi = stream.transform(fii);
>> api.Plex4.createBarcodePlot(fvi,'witness',r_max/2);
```

# Cyclo-octane

From the Matlab code above, we acquire the Betti barcodes:

Which is strongly consistent with the structure of the singular set from *Martin, Thompson, Coutsias, and Watson* as a pair of disjoint circles.

The entire computation runs in 6 seconds. (mean running time for 10 runs, std.dev. 0.8s)

# Cyclo-octane

- ▶ Computation with coefficients in  $\mathbb{F}_2$  and  $\mathbb{F}_3$  to look for torsion.
- ▶ Witness complex with 500 landmarks.
- ▶ Total complex 26M simplices.
- ▶ Computation time: 3 days.
- ▶ Severe memory issues.
- ▶ Surprising lack of difference between  $\mathbb{F}_2$  and  $\mathbb{F}_3$ : torsion killed by particular intersection of sphere and Klein bottle.

# Access to the package

## Software package

Published on <http://code.google.com/p/javaplex>

## JavaDoc documentation
