Outline

- 1 Data analysis
- 2 Data analysis in politics
- 3 Wherefore topology?

Shape of data

Fundamentally, data analysis is the task of describing the shape of data:

Fundamental data analysis techniques

Mean (centroid) tells us *where* the data is located.

Shape of data

Fundamentally, data analysis is the task of describing the shape of data:

Fundamental data analysis techniques

Standard deviation tells us how spread out the data is.

Shape of data

Fundamentally, data analysis is the task of describing the shape of data:

Fundamental data analysis techniques

Regression analyses fit the data to an easy to analyze model.

Shape of data

Fundamentally, data analysis is the task of describing the shape of data:

Fundamental data analysis techniques

Cluster analysis divides the data into its connected components.

Shape of data

Fundamentally, data analysis is the task of describing the shape of data:

Fundamental data analysis techniques

Principal Component Analysis (and other dimension reduction techniques) give new coordinates that more faithfully represent the data.

Outline

- 1 Data analysis
- 2 Data analysis in politics
- 3 Wherefore topology?

The shape of politics

Data analysis has long pedigree in political science.

- Tufte discusses improvements to techniques in a 1969 paper
- Gallups, polling, and voter prediction leverages more and stronger analysis techniques every year.

Entered into politics in the 90's. Example of the type of analyses done: PCA of votes in House of Congress.

The shape of politics

We shall focus on one area of use: the analysis of parliamentary bodies.

Dataset

For a parliamentary session, N members of parliament vote on M issues. Votes form an $N \times M$ -matrix V of votes cast. Encoded $+1$ for Yea, -1 for Nay and 0 for all other results.

c.f. Dan Rockmore's work using similarly constructed datasets.

The shape of politics

Outline

- 1 Data analysis
- 2 Data analysis in politics
- 3 Wherefore topology?**

Wherefore topology?

Topology gives qualitative information

Topology is about geometric properties not dependent on a metric:
How many pieces? Are there holes? Bubbles? Can you get turned around while moving?

Topology captures continuity, connectedness, nearness

In particular, the non-dependence on a metric helps if metrics are ill-motivated, eg phylo-genetics.

A topological analysis method

In a recent PhD thesis at Stanford [Singh, '08], a topological method for data analysis was introduced.

Fundamental topological result: Nerve lemma

Suppose a space X is subdivided $X = \bigcup_i X_i$ into *contractible* (read simple) components.

Then X is equivalent to the *nerve* of the covering.

The nerve of a covering

Mapper algorithm

Implementation

This method is provided in a software package currently marketed by Ayasdi.

Startup company founded by Gurjeet Singh (original thesis on Mapper) and Gunnar Carlsson (thesis advisor).

Questions?

Future directions

- More parliaments. We have (mostly un-analyzed) data for:
 - Sweden
 - European Union
 - Canada
 - US Senate
- Network analysis: who co-sponsors with whom, what are the parliamentary cliques?
- Flow analysis: FEC has a database over campaign donations; what can we tell about the flow of contributions?
- Meme spread: who takes over turns of phrase from whom?
